Description

The model TR21-A resistance thermometer provides temperature measurement in sanitary applications and can be used for the measurement of liquid and gaseous media in the range of -50 ... +250 °C. These thermometers are fitted with thermowells, whose process connections meet the stringent requirements, in terms of materials and design, of hygienic measuring points. All electrical components are protected against moisture (IP 67 or IP 69K).

The resistance thermometer is available with direct sensor output or integrated transmitter, which can be configured individually via the PC configuration software WIKAsoft-TT. Measuring range, damping, fault signal per NAMUR NE43 and TAG no. can be adjusted.

For easy calibration or maintenance, the sensor is removable without having to break into the process or disconnect the electrical connection. Thus hygiene risks can be minimised and downtimes can be reduced.

Resistance thermometer with VARIVENT® connection, model TR21-A

The spring-loading, integrated into the union nut, guarantees the contact between the sensor tip and the bottom of the thermowell and thus ensures a short response time and lasting high accuracy.

The welded junction between the thermowell and the flange makes the use of a sealing as additional material in those areas redundant which are in contact with the product.

Insertion length, process connection, sensor and connection method can each be selected for the respective application within the order information. The electrical connection is made via an M12 x 1 circular connector. An adapter for electrical connection with angular connector per DIN EN 175301-803 form A is optionally available (patent, property right registered under No. 001370985).

Readings in % refer to the measuring span

For a correct determination of the overall measuring deviation, both sensor and transmitter measuring deviations have to be considered.

- 1) Through their small design, face-sensitive measuring resistors serve to reduce the heat dissipation with short insertion lengths.
Available for the temperature range up to 150 °C (302 °F) in classes A and B.
For thermowell insertion lengths of less than 11 mm, face-sensitive measuring resistors are generally used.
- 2) Class accuracy AA (1/3 DIN) only valid in the temperature range 0 ... 150 °C (32 ... 302 °F)
Class accuracy A only valid in the temperature range -30 ... +150 °C (-22 ... +302 °F) or -30 ... +250 °C (-22 ... +482 °F), otherwise Class B
- 3) The temperature transmitter should therefore be protected from temperatures over 85 °C (185 °F).
- 4) ±0.2 % for measuring ranges with a lower limit less than 0 °C (32 °F)
- 5) Use resistance thermometers with shielded cable, and ground the shield on at least one end of the lead, if the lines are longer than 30 m or leave the building. The instrument must be operated grounded.
- 6) During interference consider an increased measuring deviation of up to 2 %.

7) For the TR21-A design without thermowell, the insertion length is defined by the dimension I_1 (see dimensions in mm).
The thickness of bottom of the thermowell can be neglected for dimensioning. It is offset by the spring travel of the measuring insert.

9) In the event of replacement, calculate the sensor insertion length, l_1 , as follows:

$$l_1 (TR21-A) = U_1 + M$$

10) The tolerance specification is dependent on the spring travel of the sensor/probe
